# **Reshaping Data**

#### Pivot

>>> df3= df2.pivot(index='Date', columns='Type', values='Value') Spread rows into columns

	Date	Type	Value	]				
0	2016-03-01	a	11.432		Туре	a	ь	С
1	2016-03-02	ь	13.031		Date			
2	2016-03-01	с	20.784		2016-03-01	11.432	NaN	20.784
3	2016-03-03	a	99.906		2016-03-02	1.303	13.031	NaN
4	2016-03-02	a	1.303		2016-03-03	99.906	NaN	20.784
5	2016-03-03	С	20.784	·				

#### Pivot Table

>>> df4 = pd.pivot table(df2, values='Value'. index='Date', columns='Type']

Spread rows into columns

### Stack / Unstack

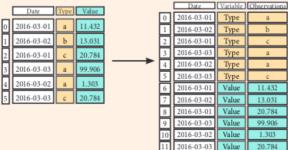

>>> stacked = df5.stack() Pivot a level of column labels >>> stacked.unstack() Pivot a level of index labels

#### Stacked

### Melt

Gather columns into rows >>> pd.melt(df2, id vars=["Date"], value\_vars=["Type", "Value"], value name="Observations")

# Iteration

(Column-index, Series) pairs >>> df.iteritems() (Row-index, Series) pairs >>> df.iterrows()

### **Advanced Indexing**

Selecting

Where

>>> df3.loc[:,(df3>1).any()] >>> df3.loc[:,(df3>1).all()] >>> df3.loc[:,df3.isnull().any()] >>> df3.loc[:,df3.notnull().all()]

Indexing With isin >>> df[(df.Country.isin(df2.Type))]

>>> df3.filter(items="a", "b"]) >>> df.select(lambda x: not x%5)

>>> s.where(s > 0)

Query >>> df6.query('second > first')

#### Select cols with any vals >1 Select cols with vals > 1 Select cols with NaN Select cols without NaN

Find same elements Filter on values

Select specific elements

Subset the data

Query DataFrame

### Setting/Resetting Index

<pre>&gt;&gt;&gt; df.set_index('Country') &gt;&gt;&gt; df4 = df.reset_index() &gt;&gt;&gt; df = df.rename(index=str,</pre>	Set the index Reset the index Rename DataFrame
--	--

### Reindexing

>>> s2 = s.reindex(['a','c','d','e','b'])

### Forward Filling

>>>	df.reind	ex(range(4)	,	>>>
		method='	ffill')	
	Country	Capital	Population	0
0	Belgium	Brussels	11190846	1
1	India	New Delhi	1303171035	2
2	Brazil	Brasília	207847528	3
3	Brazil	Brasília	207847528	4

#### Backward Filling

	>>>	s3 =	s.reindex(range(5), method='bfill')
n	0	3	
	1	3	
5	2	3	
	3	3	
	4	3	

### MultiIndexing

```
>>> arrays = [np.array([1,2,3]),
              np.array([5,4,3])]
>>> df5 = pd.DataFrame(np.random.rand(3, 2), index=arrays)
>>> tuples = list(zip(*arrays))
>>> index = pd.MultiIndex.from tuples(tuples,
                                      names=['first', 'second'])
>>> df6 = pd.DataFrame(np.random.rand(3, 2), index=index)
>>> df2.set index(["Date", "Type"])
```

# **Duplicate Data**

<pre>&gt;&gt;&gt; s3.unique() &gt;&gt;&gt; df2.duplicated('Type') &gt;&gt;&gt; df2.drop_duplicates('Type', keep='last') &gt;&gt;&gt; df.index.duplicated()</pre>	Return unique values Check duplicates Drop duplicates Check index duplicate
--	--

'b': np.sum})

# **Grouping Data**

#### Aggregation >>> df2.groupby(by=['Date','Type']).mean() >>> df4.groupby(level=0).sum() >>> df4.groupby(level=0).agg({'a':lambda x:sum(x)/len(x),

# Transformation

>>> customSum = lambda x: (x+x%2) >>> df4.groupby(level=0).transform(customSum)

# Missing Data

>>>	df.dropna()	Drop
>>>	df3.fillna(df3.mean())	Fill N
>>>	df2.replace("a", "f")	Repla

#### NaN values NaN values with a predetermined value lace values with others

### **Combining Data**

#### Merge

#### loin

>>> data1.join(data2, how='right')

#### Concatenate

### Vertical

```
>>> s.append(s2)
```

### Horizontal/Vertical

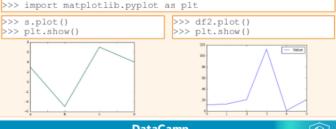

```
>>> pd.concat([s,s2],axis=1, keys=['One','Two'])
>>> pd.concat([data1, data2], axis=1, join='inner')
```

### **Dates**

```
>>> df2['Date'] = pd.to datetime(df2['Date'])
>>> df2['Date'] = pd.date range('2000-1-1',
                                periods=6,
                                freq='M')
>>> dates = [datetime(2012,5,1), datetime(2012,5,2)]
>>> index = pd.DatetimeIndex(dates)
>>> index = pd.date range(datetime(2012,2,1), end, freq='BM')
```

# Visualization

NaN 20,784
